

WG735 Dock Seal

Endura Inflatable Dock Seal (WG735)

The Endura Inflatable Dock Seal provides the most versatile seal available to service the widest variety of truck and trailer configurations.

Fast, reliable inflation

Advanced air bag and connector designs reduce bypass so more air stays in the bag while inflating, resulting in faster inflation than other inflatable shelters. Head bag and side bags quickly move into place upon activation, to tightly seal tops and sides of trailers of variable heights and widths.

Efficient deflation and retraction

Simple counterweight retraction system reduces drag, providing quicker deflation. No motorized return of deflated head bag results in improved reliability.

Easy installation

Welded steel frame construction is lighter and stronger than other inflatable shelters, potentially reducing installation time.

Advanced draft pad design

Conforming, non-inflatable draft pads reduce risk of damage and leaks, improving effectiveness and reliability of overall seal.

Available PitMaster™ seal

Gaps large and small beneath and around the dock leveler are sealed with optional PitMaster components, providing substantial energy savings, improving cleanliness and sanitation.

Retracted head and side bags.

Inflates to tightly seal along trailer top and sides.

Inflatable Dock Seal (WG735)

Inflated seal, sealing the top of the trailer. Head bag drop available up to 7'0" (2133mm).

PitMaster Under-leveler Seal.

Most versatile shelter available.

The Endura (WG735) inflatable dock seal is able to service the widest variety of truck and trailer configurations. The head and side bags inflate around the top and sides of the truck after it is backed into place. When not in use, the air bags deflate and retract behind the protective storage curtains. (Manual activation required.) Unique, foam-filled draft pads offer greater durability and long-term sealing than inflatable filler bags.

Engineered for quick, reliable service.

The head and side air bags are inflated with a single phase blower. Air bag and connector are designed for reduced bypass, which results in faster inflation and retraction. The shelter's counterweight retraction system offers less drag, which allows for larger head bag drops.

Dok-Commander® control panel.

Available interconnect system reduces risk of damage if unit not deflated/retracted before trailer pulls in or out.

Complete the seal with PitMaster™ Under-leveler Seal.

- » Seals beneath and around dock leveler and bumpers
- » Keeps pits and facilities cleaner; helps prevent infiltration of bugs, dust and debris
- » Reduces costly heating or cooling energy losses at the dock

Seal gaps around dock leveler and dock bumpers with draft pads and lip corner seals.

Dok-Commander control panel (optional).
